The American identification (ID) number was adopted in 1998 to facilitate developing national programs that not only enhance genetic progress but also animal disease control and eradication. It provides a single system of ID numbers for dairy cattle.

For genetic evaluation purposes, the ID number is recorded as a 2-character [breed code](#), a 3-character [country code](#) (USA), and a 12-digit national number. The number ranges are allocated by the Council on Dairy Cattle Breeding to ensure uniqueness. The National Association of Animal Breeders administers the allocation of numbers on behalf of the Council.

The American ID number provides a mechanism for a universal identification system. The USA country code with the animal's American ID number provides a unique number for an animal around the entire world. For Holsteins, Jerseys, Ayrshires, and Red and Whites, new foreign bulls with semen that is distributed in the United States are not issued a U.S. number. Rather, the sire's foreign national number and country code are used.

The organization that assigns an American ID number is the first one with which the animal is recorded. Animals that have already been assigned an American ID number should not be re-identified or issued a new number. A key to making the American ID system function efficiently is for producers responsibly to report American ID numbers already assigned to individual animals.

### Allocation of American ID Numbers (March 13, 2017)

FORMAT: Country code (USA) plus 12 digits

Changes since August 6, 2013, highlighted in yellow

American ID Numbers		Organization Allocated To:
